

**ABSTRACT OF THE DISCLOSURE**

5           An auxiliary handle device for use with conventional handheld  
screwdrivers for applying additional torque and reducing muscle  
strain. The device includes a handle portion designed for being  
grasped by a human hand, and a coupling portion. The coupling  
portion selectively receives a handle of a conventional screwdriver.  
10   The coupling portion is operationally coupled to the handle portion  
such that rotation of the handle portion in a first direction imparts  
rotation in the first direction to the coupling portion and to the  
conventional screwdriver in turn. The coupling portion further  
comprises a cylindrical perimeter wall forming a cavity portion.  
15   The cavity portion slideably receives a portion of the handle of the  
conventional screwdriver. The coupling portion may further  
include a retaining means. The retaining means selectively secures  
the portion of the handle of the conventional screwdriver to the  
coupling portion.
